2.0 DISCHARGE DISCUSSION AND ANALYSIS

Discharge Volume

The dry season is defined as May 15th to September 15th inclusively, and the wet season is defined as January 1st to May 14th and September 16th to December 31st. The effluent discharge volume was below the maximum allowable discharge volume during both the dry (16,000 m³/day) and wet seasons (25,000 m³/day) (Figure 2). The average discharge volume was 9,328 m³/day during the dry season and 10,987 m³/day during the wet season.

Orthophosphate as Phosphorous P04-P

Orthophosphate as Phosphorous P04-P concentrations did not exceed the permitted levels of 1.75 mg/L per day or 36.6 kg per month (as applicable) for the report period. The equalization tank and the Aluminum Sulphate dosing are both semi-automated.

Total Phosphorous

Weekly final effluent samples are submitted to a certified laboratory for total phosphorous analysis.

Total Suspended Solids

Total Suspended Solids concentrations did not exceed the permitted level of 40 mg/L per day for the report period.

Carbonaceous Biochemical Oxygen Demand (BOD)

Carbonaceous BOD did not exceed the permitted level of 30 mg/L per day for the report period.

Figure 8 Whistler Wastewater Treatment Plant Weekly Carbonaceous BOD (mg/L) 2018

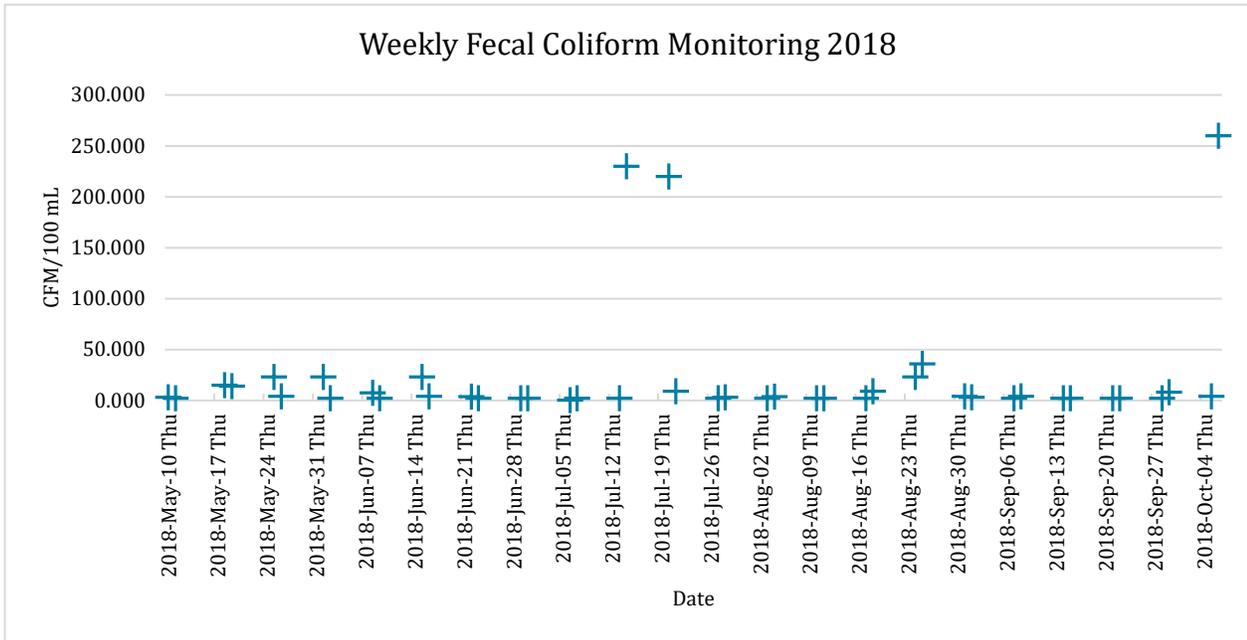

Effluent Disinfection

The WWTP disinfects the effluent using UV from May 15th to October 15th. Bi-weekly final effluent samples were submitted to a certified laboratory for fecal coliform analysis throughout the disinfection period in order to verify the effectiveness of the UV disinfection. The three elevated samples on July 25, July 26 and October 6 are the result of compromised sampling taken prior to UV treatment. These readings should be disregarded.

Note: results determined to be less than detection limit are shown on the graph as the laboratory detection limit of 2.0 cfu/ 100 mL.

Figure 9 Whistler Wastewater Plant Weekly Fecal Coliform (CFM/mL) 2018

Effluent Toxicity

Four (4) LC50 toxicity tests were performed during the report period. The results are 100% of rainbow trout fry surviving in raw (100% concentration) effluent for 96 hours.

3.0 RECEIVING ENVIRONMENT MONITORING

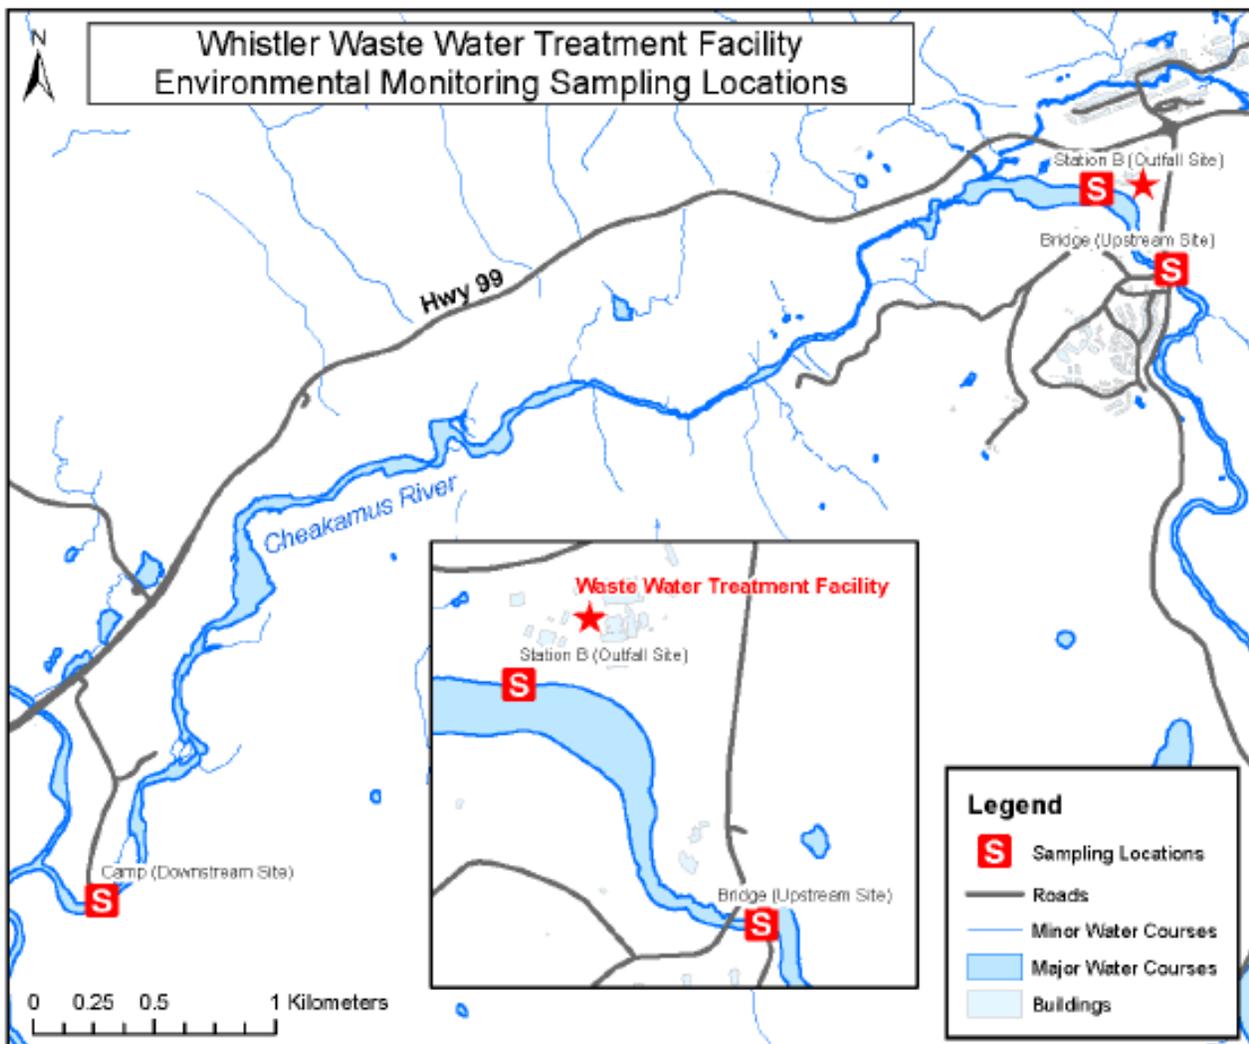

The receiving environment (the Cheakamus River) is sampled once per month by WWTP staff, and the samples are submitted to a certified laboratory.

The operating certificate requires the RMOW monitor two sampling stations, with samples taken three times per year. The RMOW exceeds this requirement by sampling at three locations, every month of the year.

The monitored parameters are compared at three sampling locations, Upstream, Outfall and Downstream (see Map 1). The upstream sampling location, Bridge, is located approximately 100 metres above the outfall, which is at Station B, and the downstream sampling location, Camp, is located approximately 4 kilometres downstream of the outfall.

Results that fall below the laboratory detection limit are thus represented as equal to the laboratory detection limit.

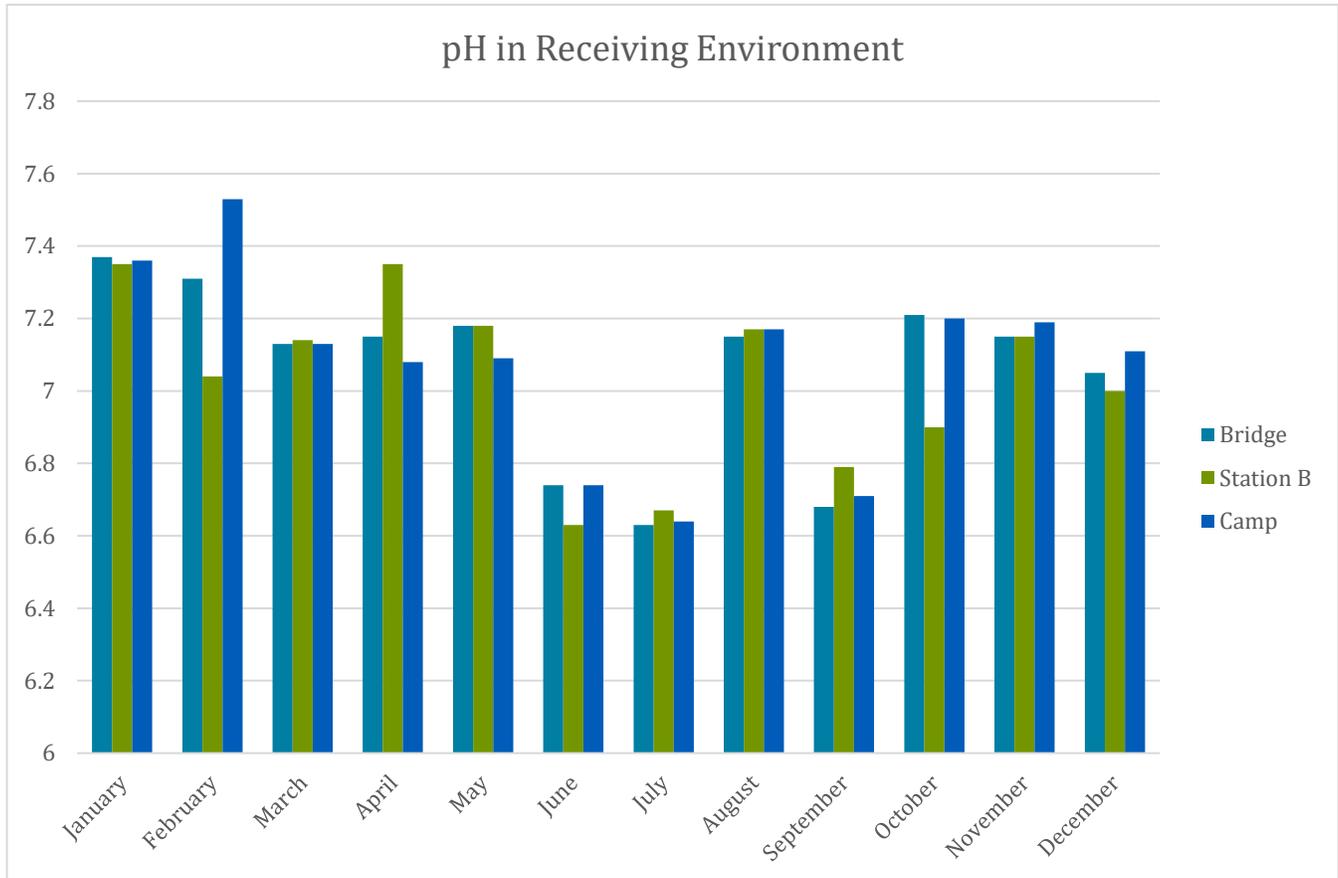

Map 1 Whistler Wastewater Treatment Plant Environmental Monitoring Sampling Locations

pH in Receiving Environment

The pH levels in the receiving environment were lower than readings in previous years for the months of June, July and September. These lower pH readings seem to reflect environmental conditions as a whole, as they are similar at all sample sites.

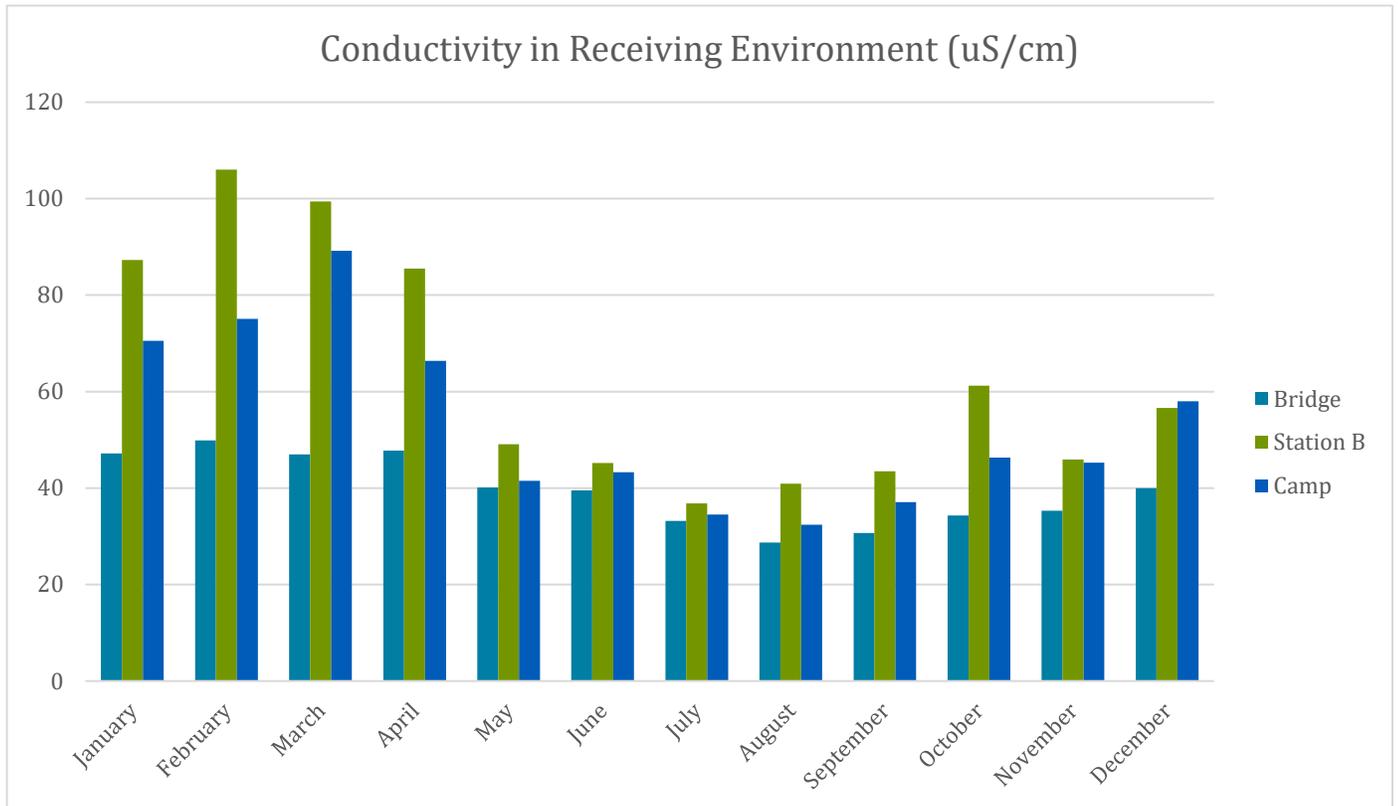

Figure 10 Whistler Wastewater Treatment Plant pH monitoring in receiving environment 2018

Conductivity in Receiving Environment

The sampling results indicate that the highest conductivity occurs at the Outfall sample location. This is similar to previous years results. The highest conductivity occurs during the winter months when the river flow is at its lowest. Throughout the year, the observed increase in conductance that could be attributed to the discharge, dissipates before the downstream sampling location.

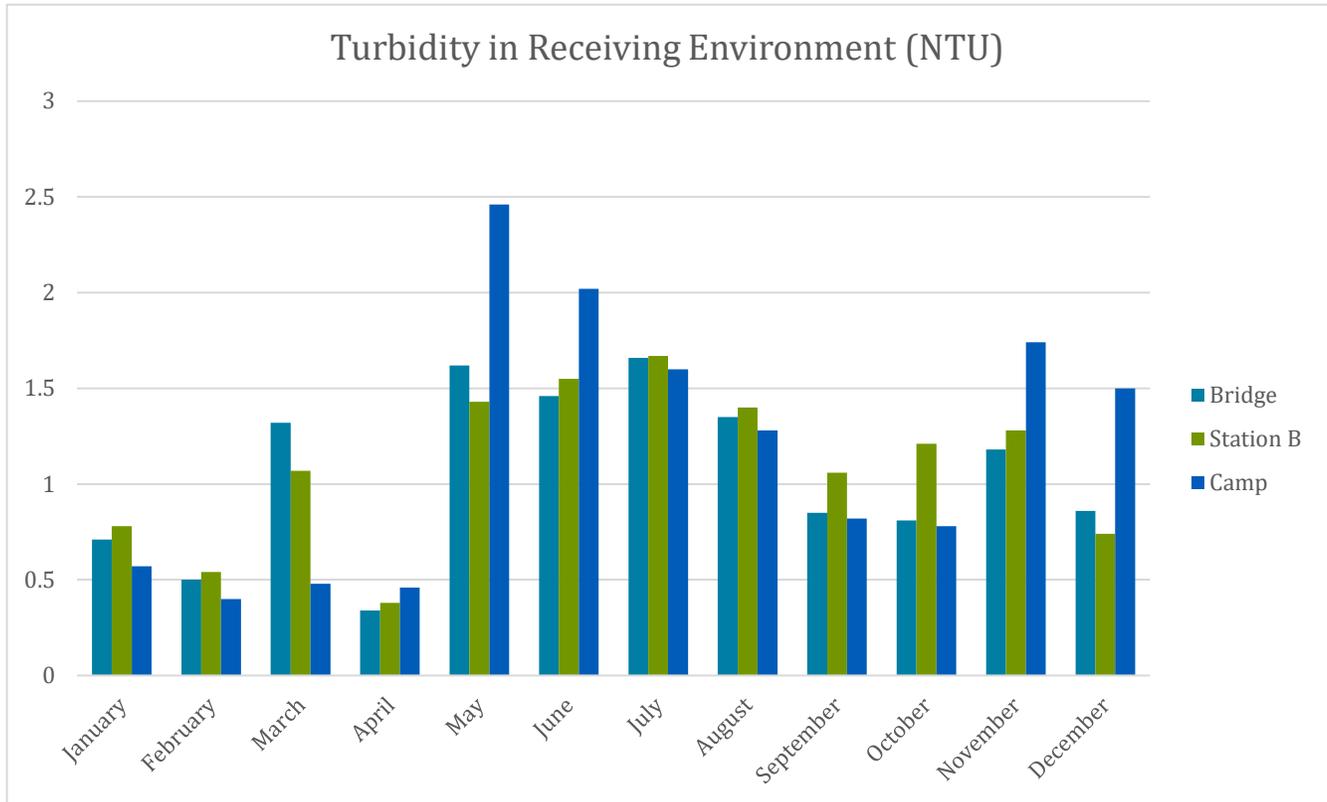

Figure 11 Whistler Wastewater Treatment Plant conductivity monitoring (uS/cm) in receiving environment 2018

Turbidity in Receiving Environment

High turbidity levels during the report period were detected at the downstream sample site in May and June. These readings are consistent with turbidity levels experienced historically.

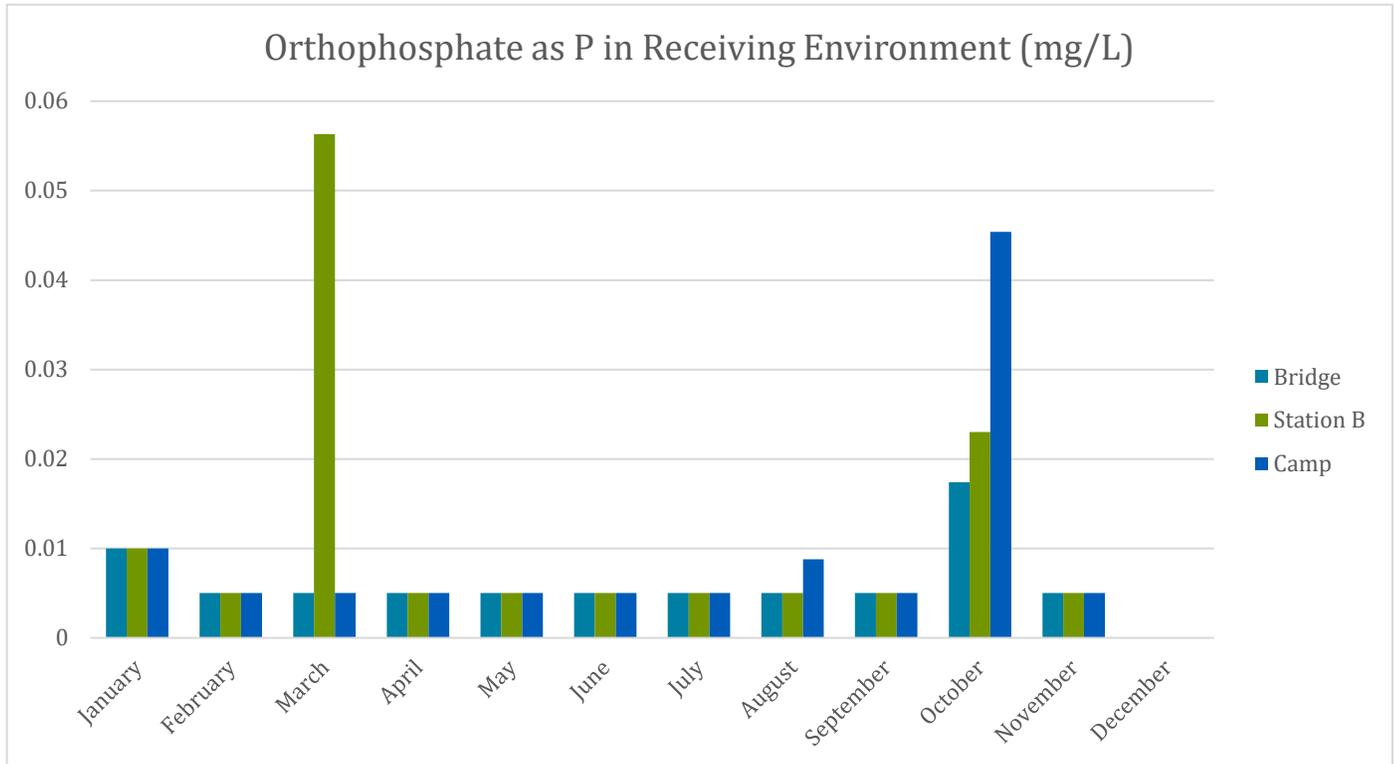

Figure 12 Whistler Wastewater Treatment Plant turbidity monitoring (NTU) in receiving environment 2018

Orthophosphate (PO₄-P) in Receiving Environment

The majority of PO₄-P readings in the receiving environment were below the laboratory detection limit of 0.01 mg/L. The detectable spikes were still below the maximum allowable PO₄-P levels.

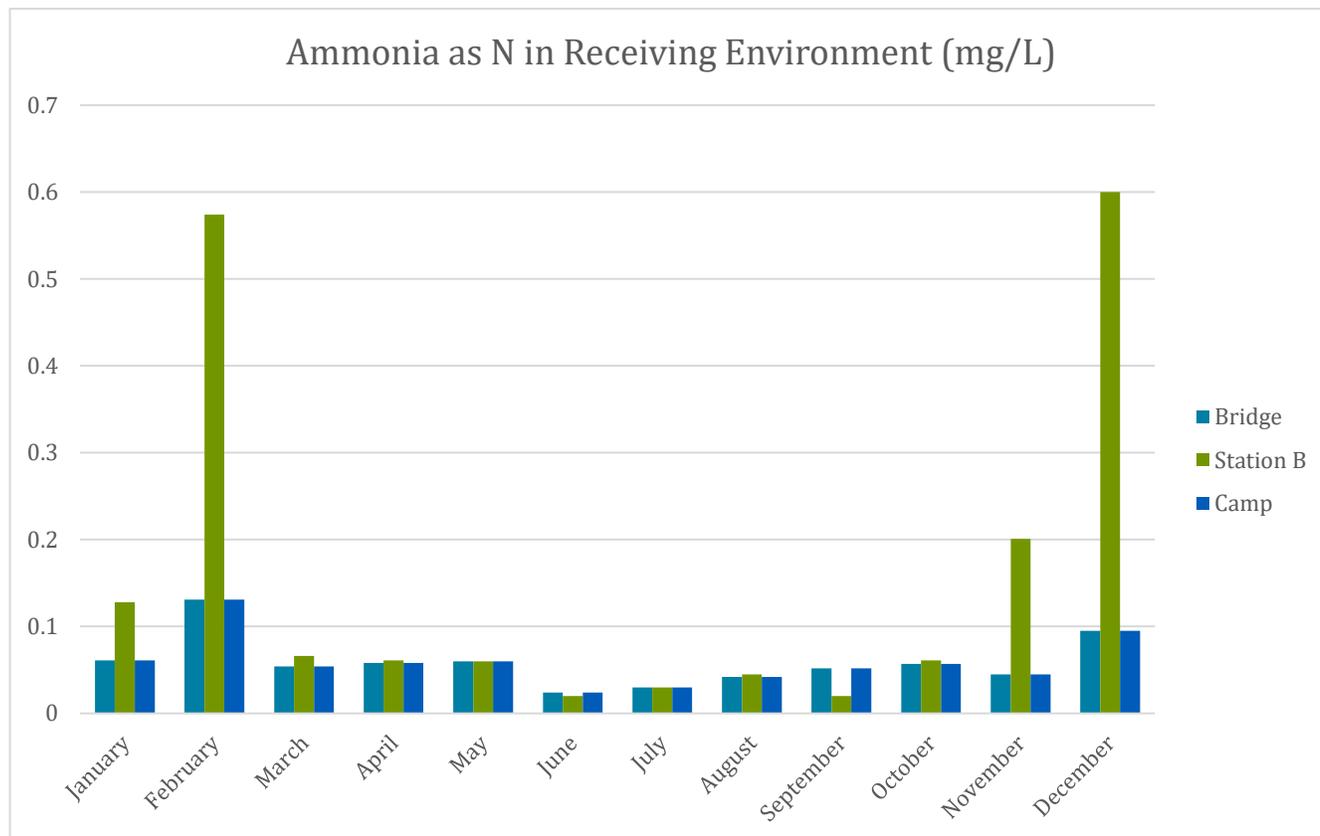

Figure 13 Whistler Wastewater Treatment Plant orthophosphate monitoring (mg/l) in receiving environment 2018

Ammonia (NH₃-N) in Receiving Environment

The NH₃ levels at the outfall location were highest in February and December. In each instance, the level was higher than the upstream sampling location and had returned to background level once at the downstream sampling location.

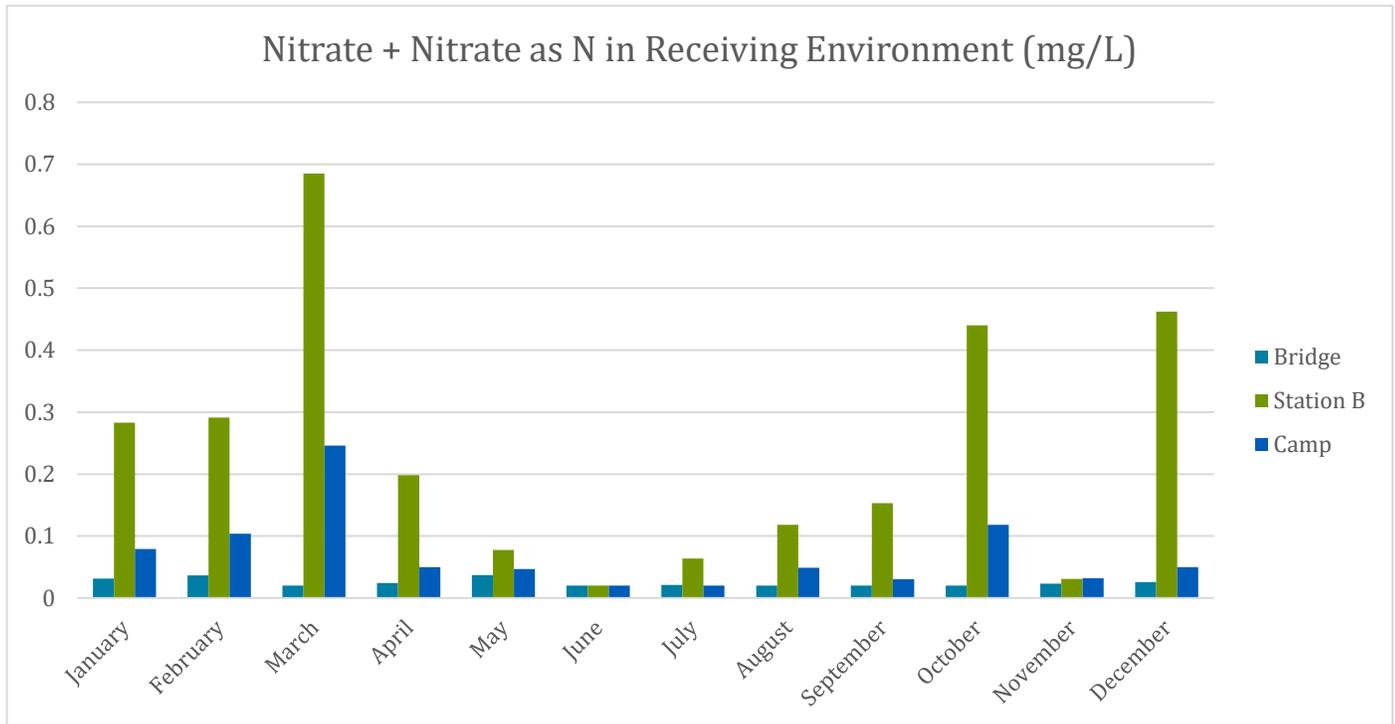

Figure 14 Whistler Wastewater Treatment Plant ammonia monitoring (mg/L) in receiving environment 2018

Nitrate + Nitrite (N+N) in Receiving Environment

There were elevated levels of nitrate and nitrites detected at the outfall sampling location every month. These spikes did show significant dissipation at the downstream sampling location, almost returning to background levels. During the summer sampling events, the effects on the receiving environment were reduced. This is consistent with the monitoring in previous years.

MEMORANDUM

RE: Whistler Wastewater Treatment Plant Outfall Inspection 2018
Operational Certificate ME-01452

FILE #: 013-34-06

Cascade Environmental Resource Group Ltd. (Cascade) was retained by the Resort Municipality of Whistler (RMOW) to conduct a visual inspection of the Whistler Wastewater Treatment Plant (WWTP) of Water, Land and Air Protection (WLAP), #ME-01452. The inspection was completed on October 17, 2018 by Candace Rose-Taylor, R.P. Bio., of Cascade.

The WWTP outfall is located on the Cheakamus River (Photo 1) and was visually inspected for abnormal cracks and disrepair in the concrete, evidence of effluent leakage in the surrounding riprap berm, and evidence of wildlife activity around the outfall. The outfall posting sign identifying a sewer outfall is evident above the high-water mark of the Cheakamus River in alignment with the outfall (Photo 1). The outfall was deemed in "good condition", with no physical deterioration or noticeable leakage outside of the outfall area (Photo 1 to Photo 6). The surrounding berm was comprised of bare large riprap boulders. There was no evidence of scavenging or denning wildlife (tracks, feces, fur) within the vicinity of the outfall. A wasp nest was observed attached to the outfall structure (Photo 6). A great blue heron (*Ardea herodias*) was also observed on a gravel bar downstream of the outfall. The effluent was discharging slightly above the surface of the Cheakamus River as water levels are currently flowing low.

Cascade recommends cutting back shrub vegetation growing on top of the berm around the outfall location (Photo 1). The WWTP Operational Certificate states that an outfall inspection is required once every five years; therefore, a subsequent inspection should be scheduled for the year 2023. Please do not hesitate to contact myself or Mike Nelson at the below contacts with any questions of concerns regarding this report.

Candace Rose-Taylor, R.P. Bio.
